

Drilling Report

Yukon Mineral Exploration Program (YMEP)

Boulevard Creek Placer Property

Whitehorse Mining District

NTS: 115J/13

Latitude: 62° 50.62" N Longitude: -139° 33.32" W

Claim List:

Independence 154	P 511332
Independence 164	P 511342
Independence 170	P 511348
Independence 183 - 184	P 511361 – 511362
Independence 303	P 512393
Independence 305 – 306	P 512396 – 512397
Independence 307	P 512398
Independence 310 – 311	P 512401 – 512402
Independence 313	P 512404
Independence 316	P 512407

Work Performed:

Mobilization:	18 to 19 August, 2020
Camp Build:	13, 14, 18 to 21 August, 2020
RAB Drilling:	22 to 31 August & 1 - 10 September, 2020
Demobilization:	11 to 12 September, 2020

1 Introduction

This unnamed creek dubbed 'Boulevard Creek' is a right limit tributary of Independence Creek. Boulevard has been targeted based on the discovery of the Coffee Gold hard rock deposit and the Sunrise-Sunset soil anomaly.

Shawn Ryan reviewed the various placer camps (outside the Klondike gold fields) in the Yukon and noticed a general theme: creeks flowing from significant gold deposits contain placer gold. Proven examples include Dublin Gulch deposit, Scheelite Dome, Clear Creek, Freegold Area, Moose Horn range, Mt Nansen, White Gold Deposit, and the closest analogy: Casino Deposit with Canadian Creek having placer gold.

This theory was the driving force behind a staking program that encompassed all the creeks around the Coffee Deposit.

Shawn Ryan hired GroundTruth Exploration Inc. and GroundTruth Drilling Inc. to conduct a seventy-hole rotary air blast drilling program that was executed between the 22nd to 31st of August and the 1st to 10th of September 2020. The drilling results indicated that placer gold exists irregularly throughout the creek.

2 Previous Investigations

A moderate amount of work has been performed on the Independence Creek placer properties. This includes ground magnetic surveys conducted in 2012. Both ground magnetic and DC resistivity surveys were completed in 2013, 2014 and 2015. Aerial photogrammetry, ground penetrating radar and ground magnetic surveys were implemented in 2016. Resolve Frequency Domain Electromagnetic survey, DC Resistivity and RAB drilling were completed in 2017. Previous RAB drilling was conducted during the field season of 2018.

3 Location and Access

The Boulevard placer claims are located 132 km South of Dawson City situated entirely in the Yukon River South watershed in west-central Yukon Territory. The target is centered at 62° 50.62" N, Longitude: -139° 33.32" W, and located on NTS map sheet 115J/13 (Figure 1). It is accessible in winter via snowmobile on the Yukon River and by helicopter year-round. The Independence Airstrip is located 5.6 km to the west and the Coffee Gold Camp has an airstrip 23.5 km to the east northeast both these airstrips can be accessed year-round.

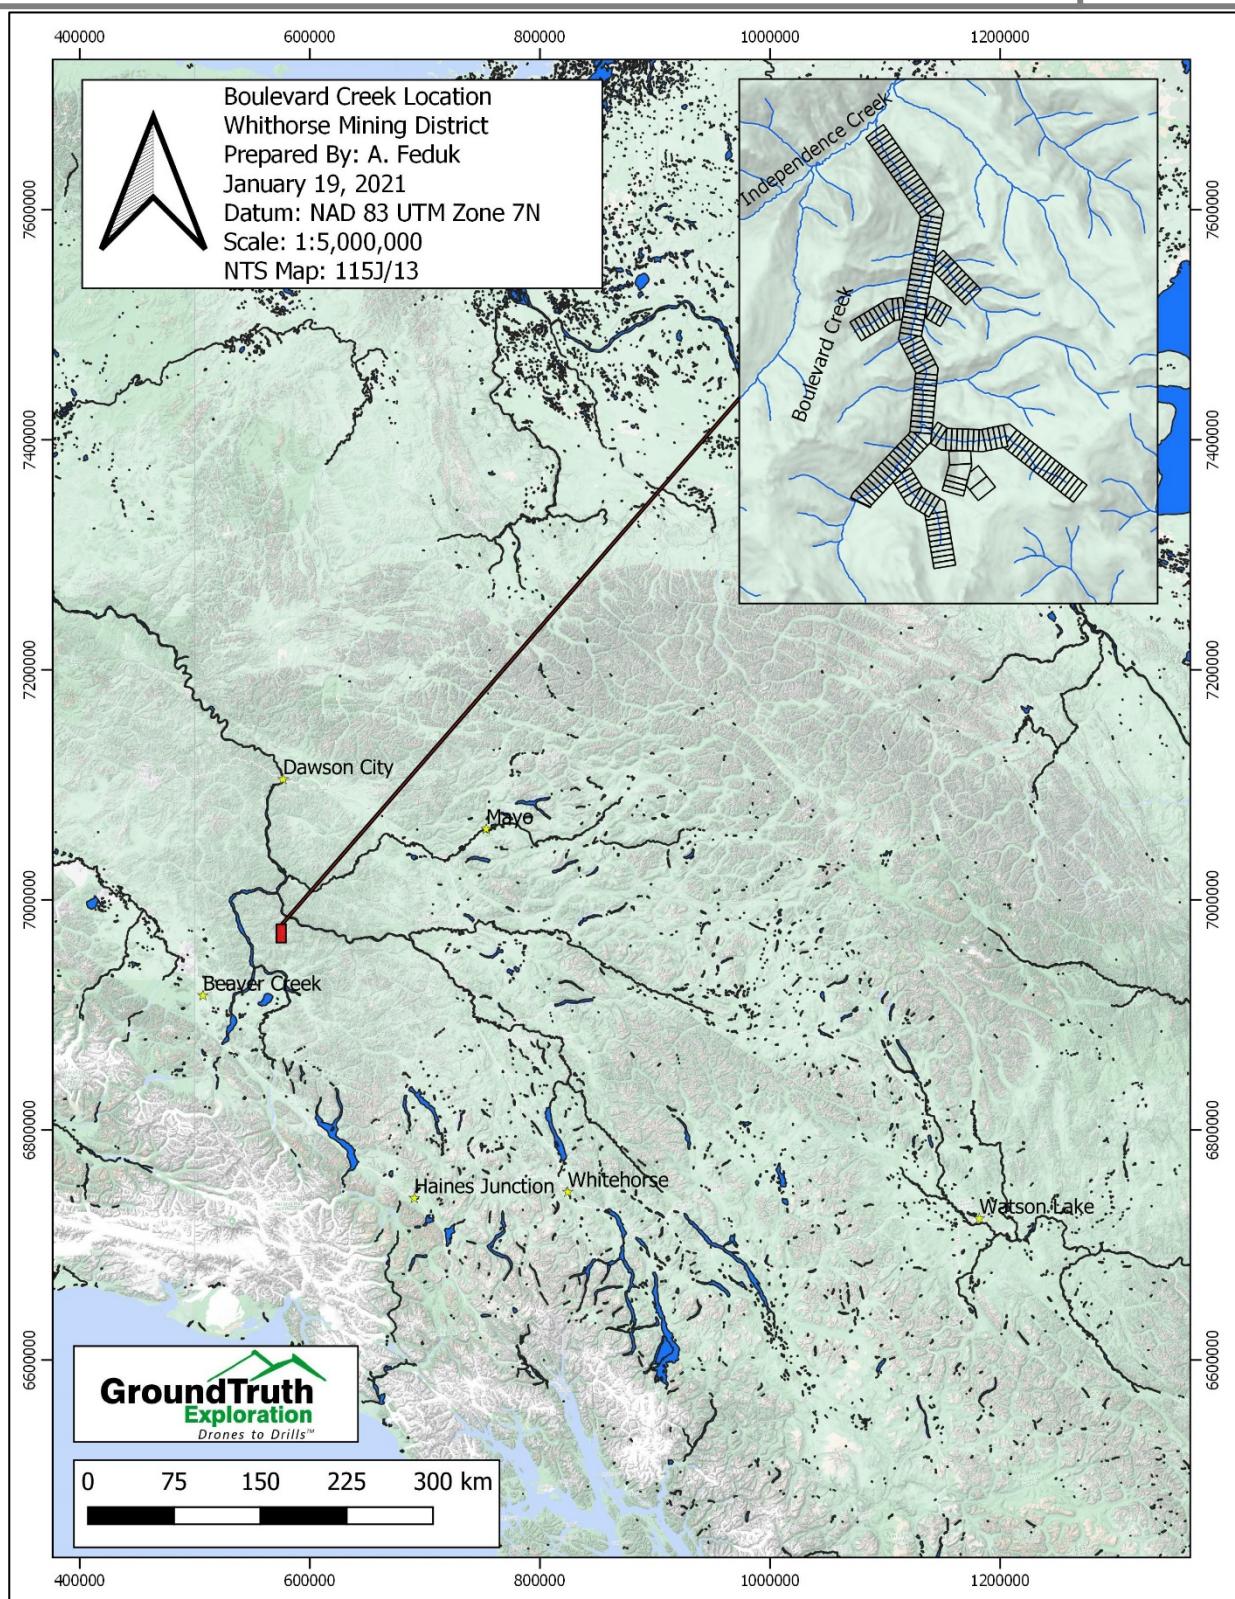

Figure 1: Boulevard Creek Location Map

4 Physiography and Climate

The landscape is composed broad valleys bordered by moderately sloped, tree-covered hills ranging in elevations from 518 m to 1402 m. The area experiences typical climatic conditions of the central Yukon Territory. The territory has a sub-arctic continental climate with a summer mean of 10°C and a winter mean of -23°C with temperatures reaching as high as 35°C in the summer and as low as minus 55°C in the winter. The property lies within Canada's discontinuous permafrost zone, most of the valley bottoms in this area are filled with permafrost.

5 Geology

5.1 Regional Geology

Boulevard Creek is situated in the Yukon-Tanana Terrane (YTT). The YTT is a late Devonian to middle Mississippian continental magmatic arc extending from northern British Columbia into west-central Yukon and eastern Alaska and is bounded to the northeast by the Tintina fault and to the south-west by the Denali fault (Colpron et al., 2006).

The YTT is composed of four main assemblages including the Snowcap, Finlayson, Klondike and Klinkit (Colpron et al. 2006) intruded by the Dawson Range batholith (phase of the Whitehorse Suite), Prospector Mountain plutonic suite and Casino plutonic suites (Mortensen et al., 2010).

“The Snowcap assemblage (PDS1) forms the base of the YTT consisting of quartzite, psammite, pelite and marble with minor greenstone and amphibolite. The Finlayson assemblage (DMF1) is composed of amphibolite, garnet amphibolite and schist. The Klondike assemblage (PK1, PK2) consists of muscovite-chlorite quartz phyllite, quartz-muscovite-chlorite schist, micaceous quartzite, psammite, phyllonite and schist. The Whitehorse Suite (mKqW, mKgW), a phase of the Dawson Range Batholith, consists of biotite quartz monzonite, biotite granite, leucogranite, monzogranite, granodiorite, diorite, granite and tonalite” (Ryan et al., 2013). “The Klinkit (CK1) is composed of mafic to intermediate metavolcaniclastic and metavolcanic rocks, with minor limestone and conglomerate”(Colpron et al., 2006; Roots et al, 2004).

5.2 Property Geology

Boulevard Creek, located in the Yukon-Tanana Terrane, flows towards the northeast trending Independence Creek fault, located directly below Independence Creek. The upper course of Boulevard Creek is underlain by Cretaceous intermediate plutonic rocks of the Whitehorse Suite, Lower Devonian clastic metamorphic rocks of the Laurentia Terrane and Permian felsic metamorphic rocks of the Klondike Assemblage. The Whitehorse Suite consists of biotite-hornblende granodiorite, hornblende quartz diorite and hornblende diorite (mKgW), the Laurentia Terrane is composed of quartzite, micaceous quartzite, psammitic quartz-muscovite-biotite-garnet schist (ODS) and the Klondike Assemblage consisting of quartz-muscovite-chlorite schist (PK1). The middle course of Boulevard Creek is also underlain by the Klondike Assemblage (PK1), as well as Cretaceous felsic plutonic rocks of the Whitehorse Suite consisting of quartz monzonite, granite, and leucogranite (mKqW). The lower course of this creek is also underlain by mKqW, as well as Upper Devonian clastic metamorphic rocks of the Snowcap Assemblage consisting of quartzite, psammite, pelite and marble with minor greenstone and amphibolite (Ryan, et al, 2016).

Boulevard Creek is intersected by two west-northwest trending dextral strike-slip faults approximately 4 km and 5 km upstream from the Independence Creek Fault; these faults are underlain by mKqW. An unknown type of fault with an east-northeast direction intersects Boulevard Creek approximately 6 km upstream from the Independence Creek fault and is entirely underlain by mKqW. Intersecting this fault is the west-northwest trending strike-slip Coffee Creek Fault. The Moose Creek Fault, trending west-northwest, separates the PK1 and ODS units of the upper course of Boulevard Creek. An unknown fault type lies beneath the upper 2.8 kilometers of the upper course of Boulevard Creek, (Ryan, et al, 2016).

Our area of study is entirely underlain by mKqW and PK1; the property has not undergone glaciation in the past; thus gold should be deposited close to its' hard rock sources (Figure 2).

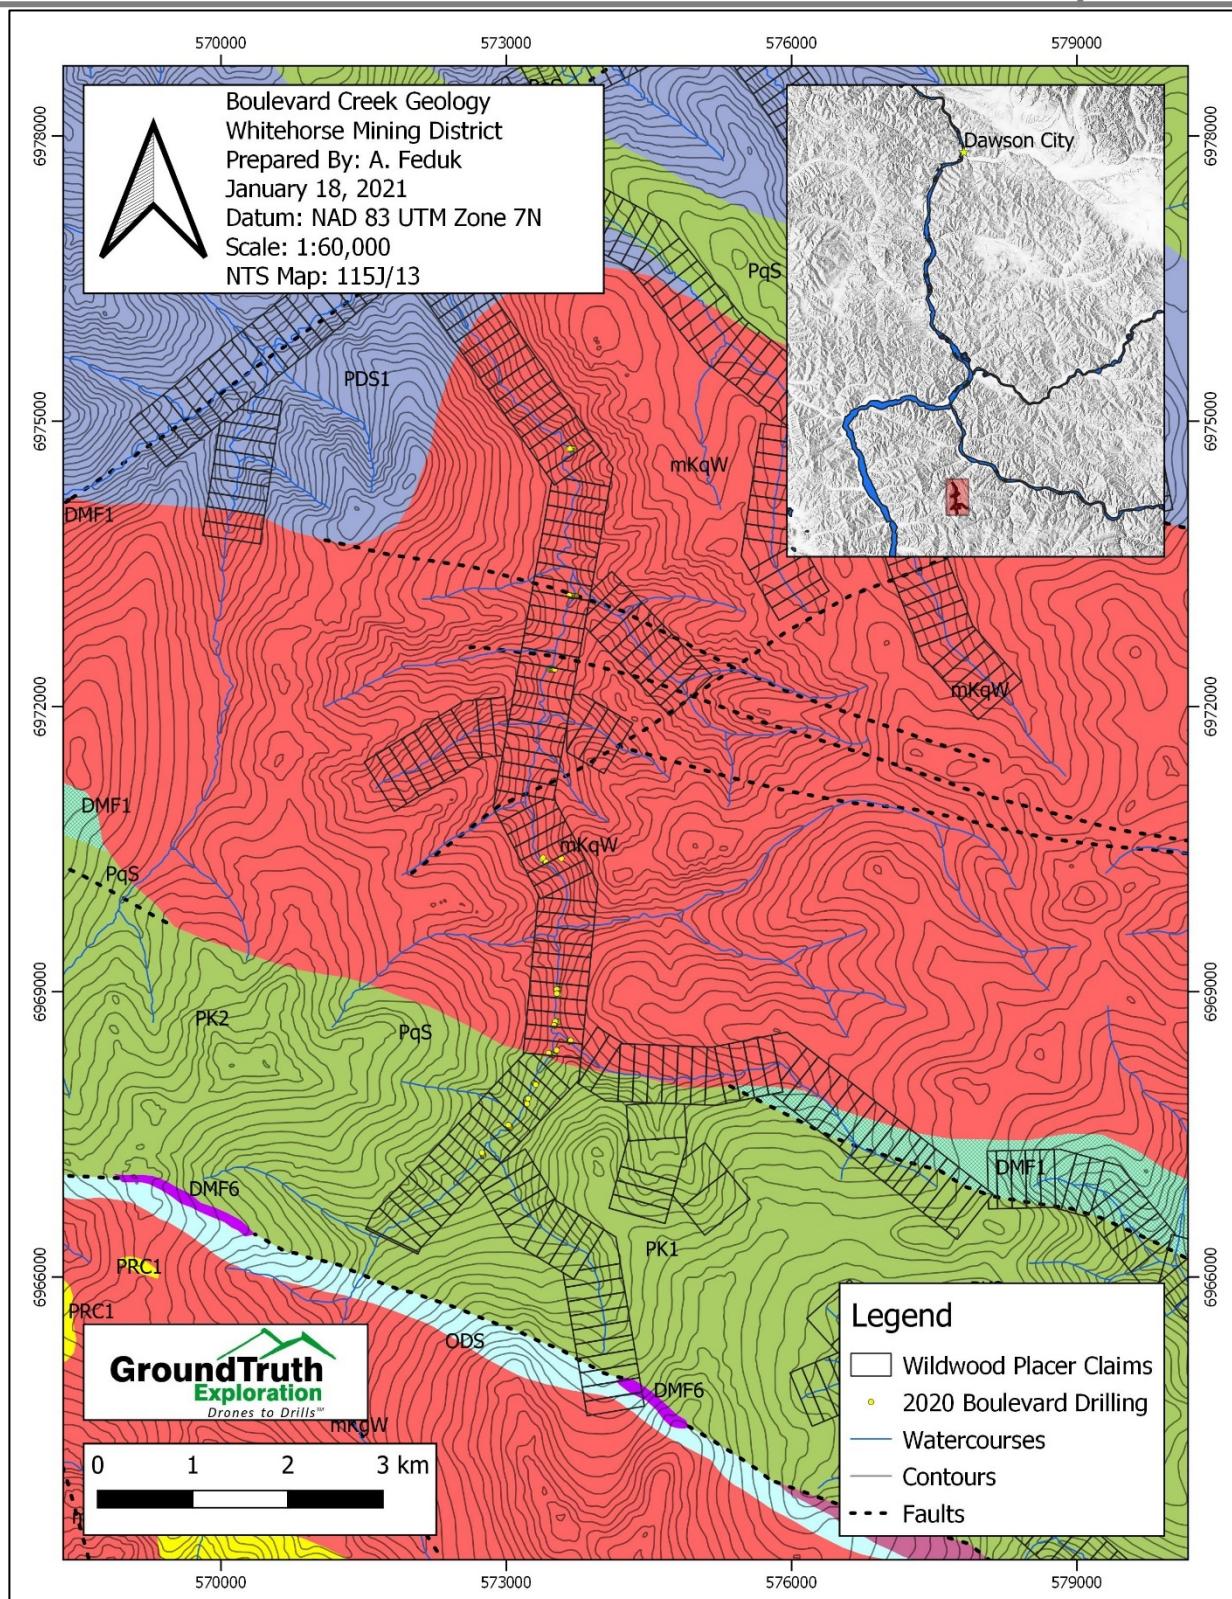

Figure 2: Boulevard Creek Geology Map

6 Rotary Air Blast (RAB) Drilling

6.1 Work Performed

The 2020 RAB Drilling program on Boulevard Creek consisted of seventy holes: BLV20-01 to BLV20-70. A total of 358.14 m was drilled between the 22nd to the 31st of August and the 1st to the 10th of September 2020.

6.2 Field Survey Operating Procedures

The GT RAB Drill is a light-weight rotary percussion drill rig mounted on a set of rubber tracks. The drill itself is powered by a 44.2 hp turbocharged Kubota diesel engine. The placer RAB drives a cased hole 5" in diameter and uses 5' drill rods. The GT RAB Drill is equipped with a wireless remote-control system used to drive it between drill sites. There are four hydraulically operated vertical outriggers on the drill for self-leveling on drill sites. The rubber tracked platform on the GT RAB Drill has 2400sq inches of track coverage area giving it 1.8psi ground pressure allowing it to be extremely versatile and low impact in the field.

The GT RAB Drill is a lightweight exploration drill rig that involves the use of DTH rotary percussion drilling equipment using compressed air from a stationary air compressor which is connected to the rubber tracked drill using an air hose. The drill uses a pneumatic reciprocating piston driven 'hammer' to energetically drive a tungsten carbide tipped drill bit into overburden and rock. Compressed air is fed through the drill rod string to the DTH hammer and with rotation from the top drive; cuttings are then returned to the surface through the annulus under pressurized exhaust air. Cuttings then pass through the diverter/BOP and continue to the cyclone and are collected in a 24" x 36" Ore Bag at the bottom of the cyclone. Drill cuttings were processed in a Gold Hog Raptor concentrator to find gold.

7 Discussion and Interpretation

It has been determined that there are some areas rich in placer gold and other areas where no gold has been deposited on Boulevard Creek. At times when a significant amount of gold was found, an additional drill line was placed either upstream or downstream from the hole with the considerable amount of gold. After the line was drilled a lower amount of gold was found. There were also tests performed when a hole hit a large amount of gold, another hole was placed approximately 1.5 m from the original hole and again less gold was discovered. From the results of these tests it can be determined that there may be a large quantity of placer gold throughout the creek and the drill may have missed the gold by a few meters.

In certain areas it was difficult for the drillers to determine when they were truly at bedrock due to the nature of the material returned from the drill: mainly dust and very small chips. It is possible that there was some error associated with estimating bedrock penetration that resulted in premature stoppage on some holes. This could be due to confusion from either a highly compacted or cemented false bottom, or from striking a large boulder.

8 Recommendations

Further drilling at closer intervals with a larger diameter casing is recommended to determine the actual grade of the placer deposits. Also, it is suggested, to shaft on each side of the drill line where a significant amount of gold was found. This test may confirm that the paystreak is confined to a smaller area, than initially hypothesized.

Additional geophysical surveys including resistivity and induced polarization, ground penetrating radar and magnetics may help to determine the actual depth to bedrock and will assist in less errors in determining bedrock depth.

10 Qualification

I, Allison Feduk with a business address in Dawson City, Yukon, and residential address in Carlyle, Saskatchewan, do hereby certify that:

1. I graduated from the University of Regina in the fall of 2011 with a Bachelor of Science in Geology.
2. From 2012 to present I have been actively engaged in mining and mineral exploration in Alberta and the Yukon Territory.
3. I have been an employee of GroundTruth Exploration Inc. since July of 2018.
4. I am not aware of any material fact or material change with respect to the subject matter of this report, the omission to disclose which makes this report misleading.

Dated this 31st day of January, 2021

Respectfully submitted,

Allison Feduk
