INTRODUCTION

The Connaught property covers an extensive system of silver-lead-gold±copper±zinc veins in the Sixty Mile placer gold camp of western Yukon. The property is 100% owned by ATAC Resources Ltd. (ATAC), with no underlying royalties.

This report describes prospecting and soil geochemical sampling conducted between August 31 and September 8, 2020 by ATAC. Management of this work was provided by Archer, Cathro & Associates (1981) Limited, on behalf of ATAC. The author reviewed all data relating to this work. The author's Statement of Qualifications appears in Appendix I. A statement of Expenditures is in Appendix II.

PROPERTY LOCATION, CLAIM DATA, ACCESS AND INFRASTRUCTURE

The Connaught property consists of 684 contiguous mineral claims, located in western Yukon at latitude 63°55' north and longitude 140°48' west on the NTS map sheet 115N/15 (Figure 1). The property covers an area of approximately 13727 ha (137.26 km²). The claims are registered with the Dawson Mining Recorder in the name of ATAC Resources Limited. Following the 2020 field season, ATAC consolidated the east side of the land package, acquiring 115 claims; 41 new claims were acquired through staking and are owned 100%; and 74 claims acquired thorough option agreements. Claim data is listed below, while locations of individual claims are shown on figure 2 and land tenure on figure 3. Property infrastructure and nearby showings are illustrated in figures 4 and 5, respectively.

TABLE I: CONNAUGHT CLAIM INFORMATION

** Expiry dates do not include 2020 work, assessment has been filed but has not yet been accepted.*

The property lies 65 km due west of Dawson City, and can be reached by four-wheel drive vehicle via the Sixtymile Road, which runs south from the Top of the World Highway. An extensive system of bush roads and trails exist on the property, but to reach them, the Sixtymile River must be forded. During spring runoff and following major storms, this ford is sometimes impassable. The Top of the World Highway extends west from Dawson City into Alaska. The highway is open during summer and fall when the ferry across the Yukon River is in service. Dawson City is situated 536 km by road north of Whitehorse, the Yukon's main supply centre, and is reached via the all-season Klondike Highway. Helicopters are based in Dawson City but were not utilized during the 2020 exploration program.

HISTORY AND PREVIOUS WORK

This section summarizes historical work in the Connaught property area. Figure 5 illustrates the location of the veins described in the following paragraphs.

Although silver-lead-gold±copper±zinc veins were likely found in the Sixtymile area in the late 1890s, the first reported discovery was made by J. Lerner and M. Chefkoi in 1965. Their exploration consisted of “cold extraction” soil geochemistry and prospecting, which led to claim staking. Lerner and Chefkoi optioned the claims to A. Moisey, who later transferred them to the Sixtymile Mining Company Ltd.

In 1966 and 1967, Sixtymile Mining carried out bulldozer trenching and electromagnetic (EM) surveys. The trenching uncovered substantial lenses of massive galena on the No. 1 and No. 3 veins. In summer 1966, a total of 22.7 tonnes of hand sorted material was collected from open cuts on the No. 1 and No. 3 veins, and shipped to the Cominco smelter in Trail, British Columbia (Harper, 1967). This shipment averaged 2.1 g/t gold, 2297 g/t silver and 67.3% lead (Cholach, 1969).

During 1968 and 1969, the property was held under option by Connaught Mines Ltd, which completed geological mapping, geochemical sampling, 35,200 m³ of bulldozer trenching and 431.8 m of diamond drilling in eight holes. The 1969 soil sampling covered much of the property at that time and generated new silver-lead targets. It also identified strong copper response in irregular clusters away from the veins. Bulldozer trenching on the geochemical anomalies led to the discovery or delineation of more vein zones, the best of which were the No. 4, No. 7 and No. 8 (Archer, 1969). Six of the diamond drill holes tested the No. 1 Vein and the other two holes explored the No. 3 Vein. Most of the holes intersected variably mineralized vein structures (Cholach, 1969).

In 1976, Connaught Mines transferred its interest to A. Tottrup, who optioned the property to J. Lerner. That summer J. Lerner extracted an additional 218 tonnes of ore from shallow pits on the No. 1 and No. 3 veins and shipped it to the Asarco smelter in East Helena, Montana.

Combined, the 1966 and 1976 shipments totalled 240.7 tonnes at an average grade of 1.0 g/t gold, 2228.5 g/t silver and 60% lead.

In 1979, A. Tottrup re-optioned the claims to Westley Mines Ltd. but there is no record of work by that company and the option was dropped after one year.

In 1981, J. Lerner staked sixteen additional claims. The entire claim block was then sold to Loughheed Resources Ltd., which cut trenches on the No. 1 Vein, totaling 4134 m³. Due to an early snowstorm, these trenches were not mapped or sampled until 1982. The claims were held in good standing by Loughheed Resources for four years but were allowed to lapse in 1986.

In spring 1987, Walhalla Exploration Ltd. re-staked the core of the property and optioned the claims to Croesus Resources Inc., which sub-optioned part of the claim block to Red Fox Minerals Ltd. and Kelan Resources Ltd. Aurum Geological Consultants Inc. was contracted to conduct an exploration program that consisted of geological mapping, geochemical sampling, geophysical surveys and bulldozer trenching (Price, 1988). The following year, Kelan Resources and Croesus Resources completed 315.8 m of diamond drilling in 10 holes. Three of the holes tested the No. 9 Vein, and extends north-northeast onto adjoining claims that are owned by another party. Another of the holes tested the No. 8 Vein and the remaining six holes explored beneath a magnetite skarn. Also, in 1988, Red Fox Minerals drilled a total of 296.4 m in eight holes directed toward the No. 4 Vein. Results from the drilling were not considered to be encouraging and all of the claims were returned to Walhalla. The claims were subsequently allowed to lapse.

In 1998, 17363 Yukon Inc. re-staked the main showings, while P. Ledwidge staked the OM claims in the area of the No. 9 Vein, and the MUG claims over the headwaters of Mosquito Creek. That year, 17363 conducted minor prospecting and geochemical sampling before contracting Equity Engineering Ltd. to perform geological mapping and geochemical sampling across the known veins and showings (Harris, 1998).

In 1999, Ledwidge optioned the OM and MUG claims to Carta Resources Ltd., which enlarged the project by staking the TOM claims to the northeast. Later that year, Carta performed geological mapping and soil sampling on both claim blocks (King, 1999).

In January 2000, Carta sold all of its claims to H. Leo King and Associates Inc. Following this, H. Leo King staked the MI 1-10 claims at the eastern end of the project. The OM, TOM and MI claims, collectively referred to as the Ami property, were subsequently optioned to Grid Capital Corporation. In 2001, Grid Capital performed soil sampling, prospecting and limited geological mapping (Lewidge, 2001).

In 2003, Grid Capital conducted induced polarization (IP) surveying on the Ami property. This work was immediately followed by a five hole, 813.8 m diamond drill program, designed to test areas of strong chargeability with coincident, anomalous soil geochemistry. Only one of these holes (DDH-03-03) is located on the current Connaught property. It intersected wide zones of polymictic breccia, developed within quartz monzonite, hosting up to 20% pyrite and minor

chalcopyrite. Grid Capital assayed portions of the hole for gold only, based on visual estimates of mineralization. It did not return any significant values (King, 2003), and the claims were subsequently allowed to lapse.

In 2005, R. Nordling staked the MAG claims to cover the No. 8 Vein and the magnetite skarn.

In spring 2006, the CN and NC claims were staked by ATAC, which immediately entered a joint venture with Klondike Silver Corp. A property-wide helicopter borne VTEM survey was flown that summer.

In 2007, Klondike Silver performed prospecting, geochemical sampling, excavator trenching and 556 m of diamond drilling in seven holes (Wengzynowski, 2008). Soil sampling was conducted on two grids to follow up anomalies from earlier soil geochemical and VTEM and magnetic surveys. Samples from both grids yielded positive results. Trenching led to the discovery of a new vein (Stirling Vein) and the formal recognition of another, previously identified structure (Core Shack Vein). Diamond drilling confirmed down dip continuity of mineralization at the No. 1, No. 3, and No. 4 veins. The VTEM and magnetic surveys conducted over the property yielded numerous VTEM conductors and magnetic low anomalies. Following up a VTEM conductor resulted in the discovery of the Rain Vein. None of the historically known veins have EM responses.

In fall 2007, ATAC and Klondike Silver optioned Mag claims from R. Nordling.

In 2008, ATAC and Klondike Silver continued with geochemical sampling, excavator trenching and excavator stripping of veins. Four thousand soil samples were collected in three grids, and analyzed for 34 elements, but not for gold. Prospecting and excavator trenching extended some known veins and resulted in the discovery of the AC/DC, Ice, Rain and PP veins. Forty-one trenches were excavated on ten targets, with only 36 reaching bedrock due to permafrost. A total of 254 rock samples were analyzed. Parts of the No. 1, No. 7, No. 8, and Stirling veins were stripped in preparation for bulk sampling (Mann, 2010).

In 2009, a modest program of prospecting, geochemical sampling and excavator stripping was undertaken by Klondike Silver on behalf of the ATAC-Klondike Silver joint venture. The No. 1, No. 3, No. 8 and Stirling veins were stripped within existing excavations with the intention of improving access for future bulk sampling. Prospecting in areas of anomalous soils discovered or re-discovered several mineralized veins not previously documented, notably the 69-3 Vein from the 1969 exploration program and a north-easterly extension of the No.7 Vein. The Nordling option was terminated at the end of 2009 (Mann, 2010).

In 2011, Seafield Explorations Ltd. staked the KAM claims, which surrounded the Connaught property to the north, northeast and southwest. That year, Seafield optioned the claims, collectively referred to as the Fifty Mile Project, to 0908937 B.C. Ltd., which collected reconnaissance soil samples across the entirety of the project. This work included one line of soil samples collected across the southern part of the current Connaught property (Pautler, 2015). The claims located southwest of Connaught were subsequently allowed to lapse.

In 2012, ATAC purchased Klondike Silver's 50% interest in the Connaught claims.

In January 2015, ATAC staked the non-contiguous OM 1-48 claims, which covered a large portion of the historical Ami property. Later that year, ATAC conducted a 10-day program of soil sampling, prospecting and geological mapping. This work was designed to evaluate the high-level copper porphyry and gold vein potential in the eastern part of the property. Samples of altered and/or mineralized porphyry material returned encouraging results, including up to 36.8 g/t silver, 0.14% copper, 2.43% lead and 2.14% zinc, while prospecting up to 1000 m along strike of the No. 9 Vein returned 7.5 g/t gold, 1040 g/t silver and 15% lead (Burrell

, 2016).

In April 2017, ATAC staked the CN 265 to 289 claims, to connect the Connaught claims to the OM claims, and the CN 290 to 301 claims, expanding the property to the south. That summer, ATAC performed grid and contour-controlled soil sampling in three areas of the property, which highlighted a previously unrecognized, broad, silver- and lead-in-soil anomaly (Burrell, 2018).

In 2017, Independence Gold Corp. staked the Stinger property, immediately southwest of Connaught. That year, Independence Gold performed four days of ridge-and-spur soil sampling, which identified an area of weakly elevated lead, silver and zinc in the southwest part of the property. Further soil sampling was recommended (Kienlen and Johnston, 2017).

In August 2018, ATAC purchased the Stinger property from Independence Gold Corp.

In 2019, ATAC conducted a program consisting of grid soil sampling and prospecting. Grid soil sampling extended coverage to the southwest of two existing soil grids anomalies and reconnaissance soil sampling covered areas with limited previous sampling (Morton, 2019). Soil sampling highlighted small clusters of anomalous silver and lead values near the Sandro and Woodpecker veins and one kilometer west of No. 8 Vein. Rock sampling was widely distributed on the property, with numerous composite and hand pit samples. Highlight results from 2019 rock sampling included 0.60 g/t Au, 117 g/t Ag and 7.83% Pb at the Sterling Vein; 1.96 g/t Au, 642 g/t Ag, 6.24% Pb and 0.19% Pb 500 m north-northwest of No. 9 Vein; 7.90 g/t Au, 1485 g/t Ag, 43.96% Pb and 0.22% Cu in a historical bulldozer trench at 69-3 Vein; and, 2.57 g/t Au, 157 g/t Ag and 1.07% Pb 60 in the northern part of the property, not previously known for mineralization.

GEOMORPHOLOGY AND CLIMATE

The Connaught property is situated in the northern part of the Dawson Range, about 45 km southwest of the Tintina Trench. The Dawson Range features rounded ridges and low peaks, which represent the top of an ancient peneplane that has been deeply incised by dendritic drainages. Continental ice sheets did not cover the area but there is evidence of localized alpine glaciation. The property is drained by creeks that flow into the Sixtymile River, part of the Yukon River watershed.

Local elevations range from about 800 m alongside the Sixtymile River to 1500 m atop a ridge near the centre of the claim block. Terrain is subdued with gentle to moderately steep hillsides flanking broad, rounded hilltops. Outcrop is rare and is mostly confined to ridge crests and road cuts. In areas where drilling has been done, the rocks are typically weathered to about 30 m below surface (Cholach, 1969). Soil development is good but there has been considerable solifluction on hillsides.

Vegetation varies from mature spruce and poplar forests on the floor of the Sixtymile River valley to sparse, stunted spruce and buckbrush near ridge tops. North-facing slopes are often moss covered and permanently frozen, which presents a significant obstacle to soil sampling, trenching and road construction.

The climate in the Connaught property area is typical of northern continental regions with long, cold winters, truncated fall and spring seasons and short, mild summers. Temperatures typically vary from 20 °C in summer to -35 °C in winter. The property is mostly snow free from early June to late September; however, snow can fall in any month.

REGIONAL GEOLOGY

Geology in the vicinity of the Connaught project was most recently mapped by Mortensen (1996) and put into broader context by Gordey and Makepeace (1999). Regional-scale geological maps appear on the Yukon Geological Survey (YGS) website, which is periodically updated when new information becomes available (YGS, 2019).

The Connaught property is located within Yukon-Tanana Terrane (YTT), as shown on Figure 6. YTT represents a continental arc that developed between Late Devonian and Permian time along the ancient Pacific margin of North America. The segment of YTT containing the property is bounded by the Tintina Fault, 65 km to the northeast, and the Denali Fault, 170 km to the southwest. Both faults are steeply dipping transcurrent structures that have seen hundreds of kilometres of dextral strike-slip offset (Colpron and Nelson, 2011; Peter et al., 2007).

The geology in the vicinity of the Connaught project can be divided into two main domains: the southern domain, which is mostly underlain by the South Fiftymile Batholith; and the northern domain, which contains supracrustal rocks of the Nasina and Klondike Schist assemblages (Figure 7). The major lithological units are briefly summarized in the following paragraphs.

The Nasina Assemblage comprises Upper Proterozoic to Late Devonian and Mississippian fine grained, moderately to non-carbonaceous, quartz-muscovite-chlorite schist and quartzite with locally abundant interlayered mafic schist and amphibolite. Locally some higher grade metamorphic equivalent rocks are also present including coarse grained, garnetiferous biotite-quartz-muscovite schist and amphibolite. Lenses of recrystallized limestone are also present east

of the project. The dominant foliation in the metamorphic sequences strikes 150° and dips 30° to the northeast.

The Klondike Schist Assemblage is largely Carboniferous to Upper Permian felsic schists of volcanic affinity. Micaceous quartzite and quartz-feldspar-muscovite-biotite schist are commonly interlayered with the felsic schist. This assemblage forms a klippen that sits atop the Nasina Assemblage.

The South Fiftymile Batholith is a large body of granitic orthogneiss that contains coarse potassium feldspar augen. This unit is considered to be part of the Late Devonian to Early Mississippian Grass Lakes Suite (ca. 357–365 Ma).

An east-trending string of Late Cretaceous plugs and stocks intrude the Nasina Assemblage and South Fiftymile Batholith along the ridge that underlies the project area, extending eastward off the claim group. These magnetite-bearing plutons consist of fine to medium grained, equigranular biotite-hornblende quartz monzonite and granodiorite. Regional magnetic data demonstrates that the plugs and stocks are probably apophyses of a much larger east-trending batholith sized body. A dyke that is likely related to this suite is seen in the high wall of the No. 3 Vein pit.

The Connaught project lies along the recently identified Sixtymile-Pika fault system (Sanchez et al, 2014). This northeast-trending structure, identified from a systematic re-interpretation of regional aeromagnetic data sets from Alaska and Yukon, is thought to have focused Late Cretaceous porphyry, skarn and epithermal style mineralization at many locations along its 150 km length (Figure 7). A number of local-scale, northeasterly-trending normal faults are also present in the region, probably subsidiary to the larger scale structure. Twenty major vein structures have been identified on the property. These veins form two sets: one striking east-north easterly and the other north-north easterly. These probably occupy dilatant structures related to the Sixtymile-Pika Fault.

PROPERTY GEOLOGY

Only cursory property-scale mapping has been completed on the Connaught property, because outcrops are typically restricted to ridges/spines and road/creek cuts. Figure 8 shows the property-scale geology.

Connaught Property lies within the structurally controlled northeast-southwest trending fault system known as the Sixtymile-Pika Fault System, which represents a structural control on Cretaceous magmatism, hydrothermal activity and associated porphyry, skarn and epithermal mineralization (Sanchez et al., 2014). The property is underlain by Carboniferous-to-Devonian gneiss, marble and metavolcanic rocks and Permian schist rocks which are intruded by the late Cretaceous Prospector Mountain Suite granitic intrusive rocks.

Lithologies in the Connaught property are based on regional and limited property-scale mapping. Detailed descriptions of each lithology are outlined below, while their distribution with respect to one another is displayed on Figure 8. From oldest to youngest, these include:

- **DMgG** – Grass Lakes Suite: Fine to medium grained, foliated granodiorite, granite and quartz monzonite.
- **DMF5** – Finlayson Suite: Light grey to white marble that is locally crinoidal.
- **DMF4** – Finlayson Suite: Light green to grey, fine grained siliciclastics and metavolcanic rocks.
- **DMF3** – Finlayson Suite: Dark grey to black carbonaceous metasedimentary rocks and metachert.
- **DMF1** – Finlayson Suite: Intermediate to mafic volcanic and volcanoclastic rocks.
- **PK2** – Klondike Schist Suite: Silvery grey muscovite-chlorite quartz phyllite and micaceous phyllite.
- **uKC1** – Carmacks Suite: Augite-olivine basalt and breccia.
- **LKgP** – Prospector Mountain Suite: Multi-phase intrusive rocks consisting of weathering resistant hornblende-biotite granodiorite, hornblende diorite and recessive weathering quartz monzonite.

There has been little geological mapping conducted during previous exploration on the Connaught project. Recent property-scale mapping (Morton, 2019) has demonstrated that the intrusive complex is much more extensive than shown on the existing maps derived from 1:50,000 mapping by Mortensen (1996). The recessive weathering quartz monzonite is more common in the eastern half of the Connaught property. A third phase of highly felsic dykes, with minor graphic granite pegmatite is also present near the east-trending edge of the Connaught property. Property-scale mapping identified a nearly continuous east-trending band of granitic rocks underlying the eastern part of the Connaught property (Morton, 2019). Prospector Mountain Suite intrusive rocks are the host rocks for the historic Butler Mo+Cu±Au porphyry occurrence on the east end of the property.

Most of the intrusive body is present on surface as felsenmeer boulders, with very little outcrop. The recent mapping is consistent with the airborne magnetic signature of the project and are observable as linear east-west trending features in both Total Magnetic Intensity and 1st Vertical Derivative geophysical surveys (Figures 9 and 10, respectively).

Major north- and northeast-trending faults have been mapped offsetting the intrusive complex in the eastern part of the property, which suggests that the faults may be the youngest structures.

MINERALIZATION

The Connaught property lies within the Tintina Gold Belt, a mineralized belt that comprises a

200 km wide by 1200 m long arc that extends from northern British Columbia to Alaska. The project area has mostly been explored as a high-grade silver-lead ± gold vein prospect modelled after the highly productive mines in the Keno Hill District, located about 250 km to the east. Some exploration has also been directed to skarn and porphyry copper mineralization on adjoining claims further to the east. Placer gold has been mined from many creeks in the area for over 100 years.

Sub-epithermal veins, magnetite skarns and potentially porphyry style mineralization has been noted on the property. Following Sillitoe (2010), sub-epithermal veins and magnetite skarns are peripheral to proximal expressions of a Cu±Au±Mo porphyry center. Mineralization and alteration in Cu±Au±Mo porphyry systems is horizontally and laterally zoned from the porphyry center, which often contains multiple generations of intermediate to felsic intrusions. Abundant sub-epithermal Pb-Ag±Au veins are found primarily on the west side of the property, with magnetite skarns occurring in central to slightly on the east side of the property. Multiple Prospector Suite intrusive rocks have been mapped, primarily in the east and lesser central areas, possibly indicating a trend in mineralization to porphyry style in the eastern portion of the property.

To date, 25 mineralized veins have been identified on the property (Figure 5). These vein zones are hosted by dilatant fault structures up to several metres in thickness. Individual veins have been traced for lengths in excess of 260 m and most are open along strike and down dip. Typical vein exposures consist of multiphase quartz that is variably mineralized with blebby to massive arsenopyrite + galena ± chalcopyrite ± covellite ± stibnite ± sulphosalts. Massive galena ± anglesite lenses are intermittently exposed in the core of some veins. The galena is usually coarsely cubic and contains scattered blebs of chalcopyrite. Anglesite weathered surfaces often exhibit botryoidal textures and some show shear textures. The veins and adjacent selvages are usually light coloured compared to the surrounding units and are often tinted green, because of oxidization of arsenopyrite to scorodite and sericitization of mafic minerals. Bleached phyllic- and argillic-altered halos extend up to six metres into adjacent wallrocks.

The No. 1, No. 3, No. 8, Stirling and Ice veins strike 050 to 094° and dip sub-vertically to 070° to the south, while the No. 2, No. 4, No. 5, No. 6, No. 7, Core Shack, PP and AC/DC veins strike 020 to 038° and dip steeply. The AC/DC vein has a unique orientation, with a strike of 020° and steep dip.

The following are brief descriptions of the thirteen mineral occurrences that have been identified on the property.

The **No. 1 Vein** has been delineated by 32 bulldozer trenches for roughly 200 m along strike but it is inferred to continue for an additional 1000 m based on anomalous lead-in-soil geochemistry. The surface trace is marked by a subtle linear gully that is evident intermittently along a talus covered, northwest facing slope. The host rocks are gently northeast dipping orthogneiss of the Grass Lakes Suite (formerly South Fiftymile Batholith) with narrow layers of coarse biotite-muscovite schist. The vein strikes northeast and has a sub-vertical dip.

Mineralization is dominated by pale green and yellow stained, sulphosalt-bearing quartz. This material is exposed in all trenches excavated across the vein and ranges in width from 30 cm to four metres. Four semi-massive to massive galena lenses occur in the core of the vein along a 125 m strike length, with widths ranging from zero to 30 cm.

The largest and most continuous of the galena lenses is exposed at the northeast end of the floor of the historical bulk sample pit. This lens is approximately 67 m long. The galena lens frequently bifurcates from a single wide band into multiple narrow stringers. The best assays from this lens were 2550 g/t silver and 10.90 g/t gold. The pit from which most of the bulk sample has a seven metre tall, cracked pit wall and is currently filled with water.

The **No. 2 Vein** has been exposed for a strike length of about 90 m along a 030° trend. It exhibits steep southerly dips averaging 76°. This vein has a composition similar to the No. 1 Vein but it has stronger wallrock alteration, with a bleached halo that extends up to six metres into the footwall rocks. Much of the trenching was done in 1987, with detailed mapping and sampling (Keyser, 1988). No excavator trenching has been done across this vein in recent years.

The **No. 3 Vein** is the most northwesterly vein on the property. It has been outlined by trenching for roughly 100 m along a 067° trend. It has steep southerly dips between 70 and 79°. The best mineralization is exposed at surface along a 10 m strike length where massive galena occurs with subordinate arsenopyrite and pyrite plus traces of covellite, in a multi-episodic quartz-sericite gangue. This portion of the vein is exposed in an approximately 8.5 m deep pit from which most of the historical bulk samples were taken. A five-metre-long massive anglesite and galena lens that is up to 1.25 m wide can be traced along the pit floor. The mineralization is hosted within highly fractured, bleached and rusty weathering quartzite and quartz-muscovite schist, tentatively assigned to the Klondike Schist Assemblage. A narrow intermediate dyke is exposed in the pit wall.

A series of narrow galena-rich veinlets and stringers bifurcate from the main lens into the footwall strata. Some sulphosalt minerals are also disseminated in quartz-rich wallrocks adjacent to this vein. A channel sample across the No. 3 Vein returned 0.87 g/t gold, 2450 g/t silver and 48.8% lead over 1.25 m.

The **No. 4 Vein** lies approximately two kilometres northeast of the No. 1 Vein and is exposed for 260 m along the northwestern side of an alpine knoll. It is hosted by orange weathering hypidiomorphic medium-grained Cretaceous granodiorite locally interfingered with quartz-feldspar orthogneiss of the Grass Lakes Suite (formerly South Fiftymile Batholith). The vein strikes 035° and dips steeply south, averaging 77°. It dominantly consists of multi-episodic quartz that is variably mineralized with sulphosalts. The vein is surrounded by strong clay alteration. In 1969, operators reported an “average assay” of 624 g/t silver and 9.34% lead across 1.22 m for a series of chip samples collected along the northeastern most 152.4 m long portion of the exposure (Price, 1989). These samples include peak grades of 2451 g/t silver and 34.90% lead across 0.73 m.

In recent years, excavator trenches were cut at equal intervals along an 80 m section at the southwestern end of the No. 4 Vein exposure. Trenches tested the footwall portion of the previously defined vein, which was mostly covered by talus, and attempted to explore the projected trace of the vein to the southwest. The trenches dug into the footwall of the vein zone discovered new mineralization in a splay off the main structure. The other trenches did not reach bedrock due to permafrost. One of the best intervals from this vein returned 1.295 g/t gold, 1550 g/t silver and 10.05% lead over 2.10 m. A chip sample from one of the new trenches yielded 0.115 g/t gold, 186 g/t silver and 2.44% lead across 1.0 m of strongly clay altered granodiorite mineralized with disseminated sulphosalts (Mann, 2010).

The **No. 5** and **6 veins** lie roughly on trend with the No. 1 Vein, about two kilometres to the northeast. Both veins are poorly exposed in old bulldozer trenches roughly 20 m apart. The No. 5 Vein trends east-northeast, and the No. 6 Vein trends east-southeast. Following this trend further northeast leads to the PP Vein.

The **No. 7 Vein** and the **Stirling Vein** are located approximately three kilometres west of the No. 4 Vein. There are several mineralized veins present in this area. The southwesterly extension of the No. 7 Vein trend was followed onto the next ridge across the creek and was examined by trenching. This work discovered two parallel veins that yielded peak values of 0.5 g/t gold, 177 g/t silver and 2.28% lead across 1.32 m.

The southern-most trench in the No. 7 Vein area exposed a quartz-sulphosalt vein with massive galena lenses up to 55 cm wide and 23 m long, within a vein zone that is approximately 50 m long and open in all directions. The vein is hosted within competent orthogneiss and strikes between 020° and 045° with a steep dip to the west at 80°. The northern-most galena lens is open along strike to the northeast where it projects beneath an access road. Channel and rock samples taken at various points along this vein returned 0.997 g/t gold, 3150 g/t silver and 64.0% lead over 0.40 m.

Recent prospecting successfully identified mineralized float associated with a broad multi-element soil anomaly along the No. 7 Vein trend. Two samples collected at least 500 m northeast of the trenches returned 3.98 g/t gold, 201 g/t silver and 30% lead, and 1.71 g/t gold, 1705 g/t silver, and 12.2% lead. The No. 7 Vein trend appears to have excellent potential in this area, as the two samples were found several hundred meters apart.

The **Stirling Vein** was found by deepening an old bulldozer trench situated approximately 400 m northeast of the No. 7 Vein. The Stirling Vein is composed of sulphosalt-bearing quartz with intermittent massive galena lenses up to 47 cm wide. The vein is exposed for a strike length of 22 m in tuffaceous quartz-feldspar-biotite-muscovite schist. It strikes 094° and dips steeply south at 70°. The mineralization is open along strike. Channel sampling returned 0.67 g/t gold, 2660 g/t silver and 64.5% lead over 0.47 m. Excavator trenching along strike revealed an extension of the mineralized structure; however, the vein was relatively narrow and weakly mineralized.

The **Core Shack Vein** is exposed in old bulldozer trenches that were deepened with an excavator. This vein is one of a series of sulphosalt-bearing quartz veins that are marked by lead-in-soil geochemical anomalies in the area between the No. 1 and No. 2 veins. The excavator trenches exposed a 1.30 m wide quartz vein that is variably mineralized with yellow to green, arsenic and antimony secondary minerals, sulphosalts and minor coarse cubic galena. Chip samples collected across the vein zone returned peak values of 1.96 g/t gold, 1230 g/t silver and 15.0 % lead over 1.30 m.

The **No. 8 and No. 9 veins** are located immediately adjacent to the Connaught property on claims owned by other operators. These veins are similar to the veins exposed on the Connaught property, but have a slightly higher silver-to-lead ratio. The No. 9 Vein also has a substantial percentage of crystalline barite within the vein. Prospecting on the Connaught property up to 1000 m along strike of the No. 9 Vein resulted in the discovery of three mineralized quartz vein occurrences. Four composite grab samples were collected and returned peak values of 7.5 g/t gold, 1040 g/t silver and 15% lead (Burrell, 2016).

The **AC/DC Vein** is located alongside the main access road, approximately 1000 m east of the No. 4 Vein. The vein subcrop is exposed in an old bulldozer trench south of the main access road, as well as in four trenches, which has delineated it for a strike length of roughly 70 m on the north side of the road. Most of the bedrock is poorly exposed. The vein is up to one metre thick and contains comb quartz with small irregular masses of sulphosalts and weak to moderate, blebby and disseminated arsenopyrite. It is hosted in grey quartz-feldspar-biotite gneiss grading to quartzite. A selected rock sample of mineralized vein assayed 0.374 g/t gold, 12 g/t silver, 2.2% lead. Additional vein float was found 100 m south of the AC/DC Vein. A sample of this float returned 1.095 g/t gold, 8.41g/t silver and low lead.

The **Ice Vein** lies about 1000 m northeast of the No. 4 Vein on a northwest facing hillside. Mineralization consists of coarse cubic galena weathering to botryoidal anglesite or dense dark red limonite containing relict galena and/or crushed quartz. Yellow-green clay gouge is also present. The Ice Vein is hosted in grey quartz-feldspar-biotite gneiss. The vein strikes 049° and dips 80° to the southeast. The vein appears to be 70 cm wide with massive galena cores ranging from 20 to 25 cm wide. Chip sampling returned peak values of 2.88 g/t gold, 406 g/t silver and 4.0% lead over 1.20 m.

The **PP Vein** is located 1200 m north-northeast of the Ice Vein on a northeast facing hillside. Vein float containing galena and anglesite was discovered during a prospecting traverse that followed up soil geochemical anomalies. Five trenches were cut to locate the source of the float. A 15 cm wide galena-rich quartz-sulphosalt vein hosted in pale yellow quartzite and grey quartz-feldspar-biotite gneiss was identified. A chip sample collected from this vein returned 0.408 g/t gold, 259 g/t silver and 3.5% lead over 2.10 m. Grab samples of anglesite weathered galena float collected from the spoil piles of trenches suggest that an unexposed vein may exist to the north.

The **Rain Vein** is situated 1600 m northeast of the No. 4 Vein. It lies northwest downslope from the main access road. Trenches were cut across two strong geochemical anomalies. The Rain Vein

is well exposed in one trench and is poorly exposed in two adjacent trenches. High values obtained from rock and soil samples taken from the area suggest the vein continues to the east. The Rain Vein is composed of quartz-poor sulphide bands with antimony-arsenic sulphosalts and galena cores and pyrite, arsenopyrite and possible stibnite margins. The sulphide-rich material is hosted in bright yellow clay gouge. The galena is coarsely cubic and weathers to anglesite on rims, with scorodite stains on some faces. The Rain Vein is hosted in quartz-feldspar-biotite gneiss. Select samples of well mineralized vein yielded values up to 2.45 g/t gold, 472 g/t silver, and 12% lead.

The **69-3 Vein** was exposed in bulldozer trenches during Connaught Mines' 1969 exploration program, but no assay values were reported at that time. Prospecting in recent years resulted in the re-discovery of the vein in subcrop, and sampling of this material has returned values of up to 4.13 g/t gold, 406 g/t silver and 10.4% lead (Mann, 2010). The vein is found in an area of elevated multi-element soil geochemistry.

In 2019, a rock sample collected from a historical bulldozer trench returned 7.9 g/t gold, 1485 g/t silver, 43.96% lead and 0.22% copper (Morton, 2019). It comprised vuggy, limonitic quartz with semi-massive galena and anglesite. A series of rock samples collected from large boulders in a float train found 300 m to the northeast, yielded values up to 7.32 g/t gold, 81.7 g/t silver and 0.89% lead.

The 69-3 Vein material samples collected from the newly identified float train, were encapsulated within granodiorite wallrock.

The **Kitchen Vein** is located near the centre of the property under the current camp site, which was built in a bulldozer trench targeting a coincident multi-element soil geochemical anomalies identified. Mineralized float was collected within the trench and further to the east. Values up to 1.08 g/t gold, 783 g/t silver and over 20% lead were returned from the vein float.

The **69-2 Vein** is located about 400 m southeast of the Kitchen Vein and 700 m northwest of the 69-3 Vein, within a bulldozer trench dug in 1969 (Cholach, 1969). A grab sample of vein float from the trench returned 3.00 g/t gold, 1660 g/t silver and 14.2% lead. The mineralization is also elevated in antimony, bismuth and indium.

Rock samples collected from 2019 hand pits, located approximately one kilometre east of the 69-2 Vein, yielded strongly elevated values for silver (up to 1425 g/t), lead (up to 55.03%) and copper (0.77%). These samples likely represent the strike extension of either the 69-3, Kitchen or 69-2 veins.

The **Ridge Vein** is located in an old bulldozer trench near the main access road, a few hundred meters from the junction between the ridge road and the road to the Sixtymile River. Samples from the trench returned 1.825 g/t gold, 182 g/t silver and 1.635% copper. Mineralized float taken about 50 m west of the trench returned 0.915 g/t gold and 111 g/t silver. This vein is also strongly anomalous for bismuth (1090 ppm), thallium (1.92 ppm), and tellurium (17.75 ppm).

The **Sandro Vein** is a re-discovery of a lead- and arsenic-rich quartz vein in a historical bulldozer trench. The vein is not exposed in outcrop, but the trench lies entirely within weathered intrusive rocks. A sample from this vein returned 5.27 g/t gold with and high silver-to-lead ratios (Mann, 2010).

The **Matt Vein** straddles the Connaught and Mag property boundary, with the visible mineralization located on the Mag claims. The surface expression of this vein occurs as a narrow string of talus with a northeasterly-trend. The vein is located in an area with abundant felsic dykes.

The **Woodpecker** and **New** showings were discovered in 2010. Single cobbles of mineralized vein float were found from surface or hand pits in these areas (Mann, 2010). No source for the mineralized float was identified.

RESULTS

Exploration work in 2020 focused primarily on evaluating the eastern and southern portions of the Connaught property. The eastern half of the property is intruded by granites, diorites and quartz monzonites that have high Cu-Mo-Au porphyry potential. The intrusives in the eastern side are fresh to propylitic and sericite altered and variably pyrite-chalcopyrite-molybdenite mineralized. Additionally, grid soil sampling occurred in the northeast, central and southern sections of the property and broad rock sampling occurred in 2020. A new vein was discovered in subcrop in the southern portion of the property. A nine-day prospecting and soil sampling was conducted to follow up on recent geochemical sampling data and evaluate the eastern side of the property for Mo+Cu±Au porphyry potential. A total of 24 rock samples and 617 soil samples were collected in 2020.

SOIL GEOCHEMISTRY

To date, approximately 45% of the Connaught property has been grid soil sampled. Tightly spaced grid soil samples are a useful exploration tool on the Connaught property. Historical and recent soil sample results have identified and delineated over 23 vein occurrences, in addition highlighting numerous other anomalies, which have not yet been followed up.

Previous soil samples collected from the eastern part of the property yielded large clusters (up to 500 by 800 m) and linear trends (up to 1000 m long) of coincident anomalous soil geochemistry for elements of interest. The cluster of high values is centred on a ridge where there is likely more residual material versus samples taken farther downslope.

In 2020, crews performed grid sampling in the northeast, south and central parts of the property, with a total of 617 soil samples collected (Figure 11).

Gridded soil sampling was performed in 2020 to extend coverage to the northeast and southern sections of the property, as-well-as to infill a central section of the property. Work in the northeast and central sections identified clusters of moderately to strongly anomalous silver-, copper-, lead- and zinc-in-soil, particularly in the northeast and central sections, with peak values of 2.14 g/t Au, 6.92 ppm Ag, 455 ppm Cu, 1585 ppm Pb, and 1220 ppm Zn. Additionally, the northeast and central sections identified anomalous molybdenite and lesser gold. Soil samples collected in the southwest corner of the northeast soil section extended the geochemical soil anomaly associated with a currently unnamed Pb+Ag±Au±Cu vein.

Soil sampling in the southern end of the property identified two small clusters of strongly anomalous silver-, lead-, and zinc-in-soil, with peak values of 8.10 ppm Ag, 1275 ppm Pb, and 1160 ppm Zn.

Results from all soil sampling in 2020 are illustrated in figures 12 through 17. Certificates of analysis are included in Appendix IV.

Soil Sample Analytical Information

All soil samples were transported from the property to ALS Minerals in Whitehorse, YT in the custody of Archer Cathro employees. Samples were received, prepared and then transported to ALS Minerals' North Vancouver, BC laboratory for geochemical analyses. Soil samples were dried and screened to -80 mesh to produce a fine fraction. Splits of the fine fraction were routinely dissolved in aqua regia and analyzed for 50 elements using inductively coupled plasma-mass spectrometry and atomic emission spectroscopy (ME-MS41). All samples were also analyzed for gold using a 30g fire assay and inductively coupled plasma-atomic emission spectroscopy (Au-ICP21).

ROCK GEOCHEMISTRY

In 2020, a total of 24 rock samples were collected, focused primarily on the eastern end of the property, with few samples collected in the northeast, central and southern sections of the property (Figure 18). Results from rock sampling in 2020 are illustrated in figures 19 through 24. Certificates of analysis are included in Appendix VI.

Rock samples collected on the east side of the property were collected to test the Mo-Cu±Au porphyry potential of the area. Collected rock samples included igneous rocks with varying degrees of alteration, including quartz-sericite-pyrite (QSP) and propylitic alteration. Intrusive rocks collected hornblende-biotite granodiorite and hornblende quartz monzonite. Additionally, rock samples were taken from polymetallic veins cutting intrusive rocks. Prospecting in this area returned rock samples from outcrop, subcrop, float and composite sampling with high silver, gold, copper, molybdenum, lead and lesser zinc.

Rock samples taken from the northeast, central and southern sections were primarily float samples of oxidized material. The samples collected in the central and southern sections returned

high silver and lead, with varying gold and zinc. The northeast did not return any significant results for the elements of interest. Highlight rock samples are presented in Table II, below.

TABLE II – HIGHLIGHT CONNAUGHT ROCK SAMPLES

Sample ID	Silver (g/t)	Gold (g/t)	Copper (%)	Molybdenum (g/t)	Lead (%)	Zinc (%)
V568974	449	-	0.19	-	8.70	-
V568975	-	-	0.10	-	-	6.73
V568976	1730	0.33	0.34	-	5.35	-
V568986	1065	1.33	0.27	275	8.47	-
V568987	-	0.056	0.013	1165	-	-
V568989	3300	0.38	1.98	-	17.65	-
V568990	2870	0.31	1.69	-	23.13	-
V568996	499	3.44	0.10	-	8.12	-

**Note: dashes indicate no significant result for that element*

Prospecting in the eastern end of the property confirmed the presence of potential Mo+Cu±Au porphyry mineralization in the area.

Rock Sample Analytical Information

Rock samples were transported to ALS Minerals in Whitehorse, YT in the custody of Archer Cathro employees. Samples were received, prepared and then transported to ALS Minerals' North Vancouver, BC laboratory for geochemical analysis. Rock samples were fine crushed before a 250 g split was pulverized to better than 85% passing 75 microns. Splits of the pulverized material were analyzed by ME-MS41, which uses an aqua regia digestion and analysis for 50 elements by inductively coupled plasma (ICP) together with mass spectrometry (MS) and atomic emission spectroscopy (AES). The samples were assayed for gold by Au-AA24, which takes a 50 g charge and prepares it by fire assay before being finished with atomic absorption spectroscopy (AAS).

Overlimit values for zinc, copper, silver and lead were re-analyzed by the ME-OG46 technique which utilizes an aqua regia digestion followed by an ICP-AES finish. Overlimit values for silver determined by the ME-OG46 method were re-analyzed using the Ag-GRA21 method, which involves fire assay preparation using a 30 gram charge and a gravimetric finish. Overlimit values for lead determined by the ME-OG46 method were re-analyzed using the Pb-VOL70 method, which uses a four acid digestion and volumetric titration. Whole rock analysis was conducted using the MI-ICP06 method, which involves a lithium metaborate fusion followed by ICP-AES analysis. Hyperspectral analysis was conducted using the HYP-PKG method which includes visible and near infrared and short wave infrared spectral data collection followed by interpretation using the aiSIRIS™ package. Overlimit values for silver, copper, lead and zinc were determined by Ag-OG46, Cu-OG46, Pb-OG46 and Zn-OG46, respectively.

DISCUSSION AND CONCLUSIONS

The Connaught project hosts an extensive system of epithermal silver-lead-gold±copper±zinc veins, which are located at the head of the Sixtymile placer gold camp. Mineralized veins are associated with east-northeasterly- to north-northeasterly-trending structural zones that cut all pre-Cretaceous units. The source of mineralization was likely formed in a hydrothermal system related to Late Cretaceous plutonism. Porphyry copper and skarn occurrences in the area are probably associated with the same hydrothermal system.

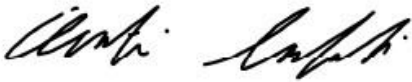

Vein mineralogy is complex and consist of multiple episodes of quartz and sulphide emplacement. Weathering has resulted in a variety of oxide and carbonate minerals which can obscure the primary mineralization. Veins contain two main phases of mineralization: silver-lead-antimony and gold-bismuth metal assemblages.

Exploration efforts in 2020 were focused on the east side of the property, which returned moderate- to high-grade silver, copper, molybdenum and lead rock samples. Rock samples collected were fresh to variably altered and weathered intrusive rocks of the Prospector Mountain Suite, including hornblende-biotite granodiorite, hornblende diorite and quartz monzonite. Soil sampling in 2020 returned multiple anomalous clusters of silver, copper, molybdenum, lead and zinc. Future work on the property would benefit from increased geophysical coverage to the east, by ZTEM, ground magnetics and/or induced polarization surveys. Additionally, a significant trenching program would be a relatively low-cost method of exposing abundant bedrock in underexplored geochemically anomalous areas and historic veins, due to abundant unglaciated soil cover on the property.

Continued systematic exploration, particularly in the east side of the property for Mo+Cu±Au porphyry potential, is warranted in this exciting district where significant discovery potential still exists.

Respectfully submitted,

ATAC Resources Ltd.

Austin Schneebeili, B.Sc., G.I.T.

APPENDIX I

STATEMENTS OF QUALIFICATIONS

STATEMENT OF QUALIFICATIONS

I, Austin Schneebeili, geologist, with business address in Vancouver, British Columbia and residential address in Victoria, British Columbia, hereby certify that:

1. I graduated from the University of Victoria in 2020 with a B.Sc. in Earth Sciences.
2. From 2018 to present, I have been actively engaged in mineral exploration in Yukon Territory.
3. I am a Geoscientist-In-Training (G.I.T.) with the Association of Professional Engineers and Geoscientists of British Columbia (Member Number 214745).
4. I have participated in the interpretation of data resulting from the fieldwork reported herein.

A handwritten signature in black ink, appearing to read 'Austin Schneebeili', written in a cursive style.

Austin Schneebeili, B.Sc., G.I.T.

APPENDIX II

STATEMENT OF EXPENDITURES

The Statement of Expenditures is not completed. Connaught property assessment report for 2020 is not yet filed and will be filed in May 2021.

APPENDIX III

CERTIFICATE WH20199288

Project: CONNAUGHT

This report is for 453 Soil samples submitted to our lab in Whitehorse, YT, Canada on 9-SEP-2020.

The following have access to data associated with this certificate:

ANDREW CARNE	ADAM COULTER
--------------	--------------

SAMPLE PREPARATION	
ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-22	Sample login - Rcd w/o BarCode
SCR-41	Screen to -180um and save both

ANALYTICAL PROCEDURES		
ALS CODE	DESCRIPTION	INSTRUMENT
Au-ICP21	Au 30g FA ICP-AES Finish	ICP-AES
ME-MS41	Ultra Trace Aqua Regia ICP-MS	

This is the Final Report and supersedes any preliminary report with this certificate number. Results apply to samples as submitted. All pages of this report have been checked and approved for release.

***** See Appendix Page for comments regarding this certificate *****

CERTIFICATE WH20199292

Project: CONNAUGHT

This report is for 202 Soil samples submitted to our lab in Whitehorse, YT, Canada on 9-SEP-2020.

The following have access to data associated with this certificate:

ANDREW CARNE

ADAM COULTER

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-22	Sample login - Rcd w/o BarCode
SCR-41	Screen to -180um and save both

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
Au-ICP21	Au 30g FA ICP-AES Finish	ICP-AES
ME-MS41	Ultra Trace Aqua Regia ICP-MS	

This is the Final Report and supersedes any preliminary report with this certificate number. Results apply to samples as submitted. All pages of this report have been checked and approved for release.

***** See Appendix Page for comments regarding this certificate *****

CERTIFICATE WH20199303

Project: CONNAUGHT

This report is for 24 Rock samples submitted to our lab in Whitehorse, YT, Canada on 9-SEP-2020.

The following have access to data associated with this certificate:

ANDREW CARNE	ADAM COULTER
--------------	--------------

SAMPLE PREPARATION	
ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-21	Sample logging - ClientBarCode
CRU-31	Fine crushing - 70% <2mm
CRU-QC	Crushing QC Test
PUL-QC	Pulverizing QC Test
SPL-21	Split sample - riffle splitter
PUL-31	Pulverize up to 250g 85% <75 um

ANALYTICAL PROCEDURES		
ALS CODE	DESCRIPTION	INSTRUMENT
Au-AA24	Au 50g FA AA finish	AAS
ME-MS41	Ultra Trace Aqua Regia ICP-MS	
Ag-OG46	Ore Grade Ag - Aqua Regia	
ME-OG46	Ore Grade Elements - AquaRegia	ICP-AES
Cu-OG46	Ore Grade Cu - Aqua Regia	
Pb-OG46	Ore Grade Pb - Aqua Regia	
Zn-OG46	Ore Grade Zn - Aqua Regia	
Ag-GRA21	Ag 30g FA-GRAV finish	WST-SIM
Pb-VOL70	Pb by Titration	

This is the Final Report and supersedes any preliminary report with this certificate number. Results apply to samples as submitted. All pages of this report have been checked and approved for release.

***** See Appendix Page for comments regarding this certificate *****

CERTIFICATE COMMENTS

ANALYTICAL COMMENTS

Applies to Method: Gold determinations by this method are semi-quantitative due to the small sample weight used (0.5g).
 ME-MS41

LABORATORY ADDRESSES

Applies to Method: Processed at ALS Whitehorse located at 78 Mt. Sima Rd, Whitehorse, YT, Canada.
 CRU-31 CRU-QC LOG-21 PUL-31
 PUL-QC SPL-21 WEI-21

Applies to Method: Processed at ALS Vancouver located at 2103 Dollarton Hwy, North Vancouver, BC, Canada.

CERTIFICATE WH20211354

Project: CONNAUGHT

This report is for 24 Reject samples submitted to our lab in Whitehorse, YT, Canada on 21-SEP-2020.

The following have access to data associated with this certificate:

ANDREW CARNE	ADAM COULTER
--------------	--------------

SAMPLE PREPARATION	
ALS CODE	DESCRIPTION
FND-03	Find Reject for Addn Analysis
SPL-21	Split sample - riffle splitter
TRSPEC-20	Spectral Scan VNIR and SWIR
INTERP-11	Spectral Interpretation (units in m)
DPTH-01	Depth

This is the Final Report and supersedes any preliminary report with this certificate number. Results apply to samples as submitted. All pages of this report have been checked and approved for release.

***** See Appendix Page for comments regarding this certificate *****

CERTIFICATE WH20252684

Project: CONNAUGHT

This report is for 15 Pulp samples submitted to our lab in Whitehorse, YT, Canada on 2-NOV-2020.

The following have access to data associated with this certificate:

ANDREW CARNE	ADAM COULTER
--------------	--------------

SAMPLE PREPARATION	
ALS CODE	DESCRIPTION
FND-02	Find Sample for Addn Analysis

ANALYTICAL PROCEDURES		
ALS CODE	DESCRIPTION	INSTRUMENT
ME-ICP06	Whole Rock Package - ICP-AES	ICP-AES
OA-GRA05	Loss on Ignition at 1000C	WST-SEQ
TOT-ICP06	Total Calculation for ICP06	

This is the Final Report and supersedes any preliminary report with this certificate number. Results apply to samples as submitted. All pages of this report have been checked and approved for release.

***** See Appendix Page for comments regarding this certificate *****
