LEGEND

QUATERNARY

Ap	Alluvial plain; flat to undulating, commonly meander scrolled, typically organic silty sand accumulations on top of sand and gravel.
At	Alluvial terrace, flat to undulating, minor channelling, gravel and sand on top of elevated bedrock terraces. May include glaciofluvial and nonglacial deposits.
Af	Alluvial fan; sloping aggregate of sorted and unsorted sediment from tributary streams. Composed of mixture of alluvial and colluvial deposits merging with other deposits.
Gt	Glaciofluvial terrace; flat to undulating, braided channel patterns, composed of mixture of loess overlying sand and gravel. Ventifacts and sand wedges locally present.
MGt	Glaciofluvial terrace related to McConnell glaciation. Weak soil development correlated to Stewart soils. Sand wedges lacking in surface deposits. Overlain by loess.
RGt	Glaciofluvial terrace related to Reid glaciation. Soils developed in sand and gravel are brown with weak chemical weathering and are correlated to Diversion Creek paleosols. Ventifacts present locally.
pRGt	Glaciofluvial terrace related to pre-Reid glaciations. Soils developed are red with strong chemical weathering and clay skins correlated to Wounded Moose paleosol. Sand wedges and ventifacts common.

SYMBOLS

- Geological contact
- Glacial limit
- Terrace scarp
- Meltwater channel (small)
- Meltwater channel (large)
- Abandoned channel
- Pingo (open-system)

SURFICIAL GEOLOGY AND GEOMORPHOLOGY DESCRIPTIVE NOTES

This preliminary map is based on 1993 mapping and airphoto interpretation. Lower Stewart River valley was mapped by inspection of soil pits, sporadic natural exposures, and a few mining cuts.

This area of the Klondike Plateau is largely unglaciated. However, outwash from multiple Pleistocene glaciations occurred in Stewart River valley, and are referred to as McConnell, Reid, and pre-Reid (Bostock 1966; Hughes et al. 1969). Stewart River valley shows several terrace remnants, some can be related to these glaciations.

The Stewart River valley is dominated by valley bottom alluvium and elevated terraces. Alluvial plain refers to the modern floodplain and low-lying valley flats. Alluvial terraces refer to those which are commonly lying on elevated bedrock terraces along the valley sides. Glaciofluvial terraces occur at various elevations in the valley and are more prominent in the upper reaches. These terraces consist of gravel overlying an elevated bedrock surface, kame terraces along the valley margins, and valley fill. A thin capping of aeolian silt and sand overlies the gravel deposits.

Soil development on high level terraces was used to assign designations as McConnell, Reid, and pre-Reid terraces using the criteria of soil colour, clay skins, thickness, and periglacial features (Morison and Smith 1987). Some terraces are uncorrelated and may be as old as Tertiary.

Placer gold occurs within the alluvial terraces, alluvial plain deposits and in glaciofluvial terrace sediments. It is typically fine-grained, flat, bright, and inclusion free. Other heavy minerals include magnetite, red garnet, and hematite.
