LEGEND

CRETACEOUS

Kg — **Tombstone Intrusive Suite:** White-weathering, fine grained hornblende +/- biotite granodiorite, quartz diorite.

White and rusty weathering, biotite-quartz-feldspar porphyry rhyolite dykes and sills.

TRIASSIC

TJL — **Jones Lake Formation:** Brown and grey weathering, fine grained calcareous and micaceous sandstone and siltstone, ripple crosslaminated; interbedded orange-brown weathering, olive green siliceous shale and recessive grey shale. Thin bedded blue-grey platy limestone contains late Carnian conodonts and *Minotis* ammonites in adjacent 105O/12 map area (M. Cecile and M. Orchard, pers comm., 1995).

PERMIAN

PMC — **Mount Christie Formation:** Orange brown, buff and pink weathering, green argillite and siliceous siltstone, laminated and burrowed with trace fossils on undersides of beds with locally abundant, grey barite nodules. Ribboned black and grey chert contains late Permian radiolarians near Mt. Osgoode.

Pb — Rust-brown weathering, black siliceous siltstone with deep orange weathering sandstone and dolostone; barite nodules and veins.

CARBONIFEROUS to PERMIAN

Probably equivalent to **Tsichu Group** (Cecile, in press; Tsichu formation of Gordey and Anderson, 1993).

CPp — Orange-brown and dark grey weathering, weakly calcareous, bioturbated and micaceous, black siltstone, fine grained brown sandstone, green shale and chert. Brown weathering, dark grey sandy limestone bed contains Early Carboniferous conodonts 5 km south of West Lake and cross-laminated limy sandstone contains early Permian conodonts 5 km west of Plata mineral occurrence.

CPc — White-weathering, grey and black chert and medium bedded siliceous argillite. Contains Permian radiolaria 4 km south of West Lake.

LOWER CARBONIFEROUS

CKH — **Keno Hill quartzite:** Grey-brown weathering, banded dark grey and black, fine-grained quartzite, thin interbeds of black shale and silicious argillite.

DEVONIAN to LOWER CARBONIFEROUS

Earn Group (probably **Portrait Lake Formation,** Gordey and Anderson, 1993)

DP4 — Brown-weathering micaceous quartz sandstone, parallel and ripple crosslaminated; minor siltstone. Equivalent to **Itsi Member** of Abbott and Turner (1990).

DP3 — Silver- and blue-weathering, well-bedded siliceous mudstone, platy and graphitic. South of Hess River grades downward from black argillaceous chert with minor centimetre-thick black limestone beds, to more recessive black, fissile siliceous shale.

Dt — Gossanous, white and yellow weathering, thin to medium bedded, white, light grey and black chert. Described by Abbott (1986).

DP2 — Dark blue-grey weathering, siliceous carbonaceous siltstone and mudstone; thin bedded black chert; conglomerate and grit with chert clasts (o o o). Minor white weathering limestone (≡) and amygdaloidal mafic flows (Dv) occur east of Fairweather Lake.

DP1 — Blue-brown weathering, siliceous shale; grades upward to thin- to medium-bedded, white, yellow weathering black chert; concretions and grey barite lenses common at Plata mineral occurrence. *Monograptus* found 9 km north of Plata occurrence.

DP — Earn Group undivided: includes some or all rock types described above.

SILURIAN

Road River Group

Ss — **Steel Formation:** Orange-brown weathering, green silicious argillite; orange weathering, thin-bedded beige dolostone, tan weathering limestone and black calcareous shale.

ORDOVICIAN (to LOWER DEVONIAN?)

OEC — White weathering, thick bedded grey, bottle-green and blue chert; grey and brown shale. Isolated beds of light grey weathering limestone contain Early to Late Ordovician conodonts and radiolarians are present in chert. Equivalent to **Elmer Creek Formation** (Cecile, in press).

UPPER CAMBRIAN to LOWER ORDOVICIAN

ЄGL — **Gull Lake Formation:** Green, brown, and olive laminated mudstone and siltstone; dark brown nodular shale; minor fine grained sandstone and grit. White weathering, nodular silty limestone (**ЄGL1**; brick pattern) contains protoconodonts 16 km southeast of West Lake, oolites on south slope of Mount Ortell. Local mafic flows and tuffs and volcanic sandstone (**Єv**) near Rogue River.

UPPER PROTEROZOIC to MIDDLE CAMBRIAN

Hyland Group (Gordey and Anderson, 1993)

Narchilla Formation

ЄNA — Maroon, brown, black and green argillite and siltstone. In 105N/16 contains thick beds of grey weathering laminated quartz sandstone (stippled). Equivalent to **Arrowhead Lake Member**, Narchilla Formation (Cecile, in press).

PЄNS — Light brown weathering grit, sandstone, thin-bedded sandstone interbedded with grey and brown shale in fining-upward succession; load casts common. In 105N/15 maroon to brick-red argillite constitutes 3-5 beds, each about 10 m thick, separated by green sandstone. Equivalent to **Senoah Member,** Narchilla Formation (Cecile, in press).

PAL — Thin, well-bedded, buff sandy limestone and white weathering, thick-bedded grey-white limestone. Equivalent to **Algae Lake Formation** (Cecile, in press) and upper limestone member of Yusezyu Formation (Gordey and Anderson, 1993).

PY — **Yusezyu Formation:** Brown weathering calcareous sandstone, quartz grit with interbedded dark grey shale and siltstone, locally graded. Includes thick bed of yellow-brown limestone (**PY1**; =).

PYb — Dark brown weathering graphitic shale, minor maroon slate and fine grained dark grey quartzite.

PYS — Strained rocks equivalent of Py, PAL and Ps: Quartz-muscovite schist with minor chlorite schist and quartz-feldspar gritty schist. Boudins and healed *en echelon* fractures are common.

PYc — Pale weathering, fine grained chloritic schist with laminar quartz-feldspar segregations, foliated metavolcanic siltstone.

Geology by C. F. Roots and D. Brent in 1993, and J. G. Abbott, M.P. Cecile, S.P. Gordey and C. F. Roots in 1994.

REGIONAL SETTING

Lansing map area lies within the Selwyn Basin, a succession of Late Proterozoic to mid-Devonian deep water sandstone, limestone, shale and chert (Hyland Group, Gull Lake Formation and Road River Group). In eastern Lansing map area these strata are overlain by late Devonian turbiditic submarine fan complexes (Earn Group) and Early Carboniferous to Triassic shallow marine shelf clastic sediments (Tsichu Group and Mount Christie and Jones Lake formations).

Selwyn Basin was brought to a close by extensional or transtensional tectonism (indicated by pre-Middle Devonian structures in the Macmillan Pass (Abbott and Turner, 1990) and Nahanni (Gordey and Anderson, 1993) map areas. Erosion of uplifted regions was the source of clastic fans within the Earn Group, and some inferred pre-Earn faults are indicated on the cross-sections.

Early Cretaceous northeast-southwest contraction resulted in upright folding of upper Paleozoic strata, and both high- and low-angle thrusts within Proterozoic and lower Paleozoic rocks. Slaty cleavage pervades incompetent units such as the Narchilla and Gull Lake formations. Overturned strata and southwest-verging folds in the Wilson Range (south of Murray Creek; cross section D) suggest a fundamental, but as yet unrecognized, structural break that connects the Tombstone thrust (see Abbott, 1990) and the Hess Fault (Abbott and Turner, 1990). Late large scale northwestward movement of the Robert Service Thrust sheet probably imparted the northwesterly cleavage and recrystallization to footwall rocks in the southwestern corner of the eastern Lansing map area.

Granodiorite and quartz diorite stocks of the mid-Cretaceous Tombstone Intrusive suite are the only undeformed rocks in the map area.

All sedimentary rocks are deformed and most units are equivalent to tectono-stratigraphic map units as described by Cecile and Abbott (1992; prefix 't'). A large region north and east of Lansing Pluton is underlain by undistinctive fine grained clastic rocks are here interpreted as Carboniferous-Permian based upon sparse localities with upper Paleozoic microfossils.

MINERAL OCCURRENCES from INAC (1992)

Minfile #	Name	Class	Major (minor) metals	status (last activity)
1	**Hugo**	unknown (general loc. only)	Pb, Ag	reported 1929
3	**Plata**	14 veins	Ag, Pb Au (Zn, Cu, Co)	mined 1976-85
4	**Rogue**	geochem anomaly	Zn (Fe)	sampled 1991 (Kennecott)
5	**Joy**	copper skarn	Cu in quartz vein	no remains of activity
6	**Golf**	skarn	Cu	sampled; no claims
7	**Etzel**	vein	Cu	unstaked
8	**Cartier**	vein	Cu (Pb, Zn, Ag)	unstaked
9	**Pebble**	unknown	Pb float	unstaked
10	**Dean**	vein (skarn?)	Pb in shears	unstaked
11	**Aureole**	vein	Cu	unstaked
12	**Bloom**	vein	Cu, Mo, Pb	unstaked
16	**Andrea**	stratiform	Ba	Prism Resources, 1981
17	**Flatasa (Aho)**	silt anomaly	Ag, Pb	staked 1992
18	**Strip**	land protection	none	former campsite
19	**Dog**	veins	Ba	noted in 1984 (GSC)
20	**Jagowerite**	vein	Ba	Noranda checked Au nearby
u1	unnamed	stratiform	Ba	Abbott, 1986
u2	**Caribou, Flower, Red (D'or Aztec)**	Zn, Ag geochem anomalies		staked 1992
u3	unnamed	stratiform	Ba	Roots and Brent, 1993

(u1, u2 and u3 are new occurrences, submitted to DIAND for next Minfile).

CROSS-SECTION NOTES

The thickness of units depicted in cross section is greater than their true thickness as measured in less deformed areas (e.g. Gordey and Anderson, 1993; Cecile, in press) as a result of structural imbrication, isoclinal folds and stacking of folds too detailed to show at this scale. Inclined short lines at the surface of the profile are true dips where measured near the line of section. Steep attitudes may result from minor folds which cannot be portrayed at this scale, and thus some bedding dips portrayed on parts of the cross section are shallower than those indicated on the geologic map. Thin, solid form lines schematically indicate folded bedding whereas dotted form lines indicate orientation of foliation (S1). This foliation is folded by small and large scale folds.

The following notes refer to areas indicated by circled numbers on the cross section:

1 This fault is the northeast limit of penetratively deformed Hyland Group. Rocks on the northeast side are tightly folded and thermally metamorphosed, but lack the sheared fabric present on the west side. Further northwest, the boundary of highly strained rocks is an indistinct strain gradient within the Hyland Group. The fault and strain gradient may be the northeastern edge of the Robert Service Thrust panel which underwent northwestward translation during Early Cretaceous time (Roots and Murphy, 1992a; D. Murphy, pers. comm., 1994). All granitic rocks in Lansing map area are post-tectonic.

2 Absence of Road River Group (Elmer Creek Formation; Cecile, in press) suggest pre-Middle Devonian uplift and erosion northeast of this fault, resulting in Earn Group deposition.

3 This steeply dipping fault extends from Fairweather Lake at least 35 km eastward and juxtaposes Hyland Group against Triassic strata. Displacement vectors are unknown but it could be a transpressional thrust.

4 Transcurrent displacement is interpreted on this fault because of its straight trace (aligned with topographic lows for 35 km northwest) and reversals in apparent vertical offset along it. Dextral translation of at least 16 km is implied by offset of the contact between Hyland Group and overlying units.

5 The South Plata Thrust (Roots and Brent, 1994b) and Plata Thrust (Abbott, 1986) juxtapose tectonically thinned, imbricated slices of maroon shale (Narchilla Formation) over Earn Group as well as Permian and Triassic strata in the footwall. Neither thrust can be traced westward and the resulting displacement must be accomodated along the northwest-trending shear faults. The large area to the west along strike and northwest of the Rogue River, shown here as underlain by Carboniferous and/or Permian strata and may be underlain by similar thrusts.

6 The Wilson Range differs from the rest of the map area in prevalence of southerly verging structures and common occurrence of overturned bedding.

7 Yuseyu grit and younger rocks are thrust over tightly folded and cleaved Narchilla and Gull Lake argillaceous rocks, and this footwall deformation extends 25 km to the northwest. The thin-skinned deformation style implied by the low-angle thrust (displacement unknown) suggest a basal detachment to most or all folds and thrusts within the map area. The depth to this detachment and the thickness of sediment beneath the detachment and above the crystalline basement is unknown.

FOSSIL DETERMINATIONS and AGE ASSIGNMENTS

1992b: Geology, Mayo map area; Exploration and Geological Services Division, Indian and Northern Affairs Canada, Open File 1992-4 and Geological Survey of Canada Open File 2483 (scale 1:250 000).

ACKNOWLEDGMENTS

The assistance of Diane Brent, Roger White and Bert Struik and discussions with Ron Berdahl and Don Murphy are appreciated. Brian Macpherson (1993) Will Tompson and Mike Dorsey (1994) of Capital Helicopters, as well as Derek Drinnan and Earne Onafreychuk of Black Sheep Aviation provided prompt, efficient service. Shann and Jim Carmicheal of Mayo Caselot Limited, Beth Hunt and Bruce Mitford of Lansing Creek, as well as the continued support of John Kowalchuk, Dianne Carruthers and Will VanRanden of the Canada-Yukon Geoscience Office smoothed logistics. Warehouse facilities in Whitehorse were made available by Steve Morison and Mike Burke of Indian and Northern Affairs Canada, and in Mayo by Richard Cocks. The isotopic date is from Jim Mortensen, Geochronology Laboratory at the University of British Columbia (1994).

This project was funded by the Mineral Development Cooperation Agreement, Canada-Yukon Economic Development Agreement (1991-1996) and the Cordilleran Division, Geological Survey of Canada, Project 900035.

LEGEND

CRETACEOUS

- mky — pegmatitic syenite
- mKg — hornblende, quartz diorite

STIKINIA

LOWER AND MIDDLE JURASSIC

Laberge Group

- JLs — greywacke, arkose, quartzite, conglomerate, siltstone, argillite and hornfels

UPPER TRIASSIC

Lewes River Group

- uTLs — massive greywacke
- uTLc — massive crystalline limestone and minor laminated chert

CACHE CREEK TERRANE

PERMIAN TO TRIASSIC

Cache Creek Group

- TJls — well-bedded ribbon chert, shale, siltstone and greywacke
- CTg — massive chloritized, medium to coarse grained hornblende - pyroxene diorite gabbro
- Pv — massive, aphanitic, locally tuffaceous (?) greenstone with clasts of limestone and chert
- CPc — massive, finely crystalline, locally crinoidal and fusiline grey limestone
- CPv — massive andesitic and basaltic greenstone, commonly spherulitic, locally pillowed
- CTu — peridotite and serpentinized peridotite, and associated ultramafic rock.

SYMBOLS

- Geological contact (defined, approximate)
- Fault (defined, approximate)
- Thrust fault
- Foliation (inclined, vertical)
- Bedding (inclined, vertical)
- Hornfels
- Regional stream silt geochemistry sample sites (elements given as ppm, except Au, Hg which are ppb) — 1012 ★ Ni 670 Hg 1070

MINFILE OCCURRENCES

Yukon Minfile No.	Name	Occurrence type
	105 D	
67	▲ M'Clintock (Ennis Hill)	Cu skarn, vein
68	▲ Oak	unknown
69	▲ Marsh (BUG)	Au,Ni,Co,Cu,W
70	▲ Lavalee	Asbestos
71	▲ Michie	Cr, Asbestos
115	▲ Worbetts	Pb, Ag, Zn, Au vein
153	▲ Ichle	unknown
154	▲ Into	unknown
176	▲ Mt. Michie	unknown
178	▲ Military (Phil)	Cr
185	▲ Bronco	unknown
196	▲ Mike	Cu
	105 C	
10	▲ Riba	Asbestos
11	▲ Seaforth	Asbestos
12	▲ Squanga	Cr, Pt
28	▲ Dalayee (TOG)	Au, Ag, Cr vein
49	▲ Nut	unknown
55	▲ Eaglenest	Au, Ag, Sb vein

ACKNOWLEGMENTS

Discussions with Mike Power and Todd Ballantine helped us to interpret the geophysics. We wish to thank the many prospectors and the Yukon Prospectors Association who provided us background information and support for this project. This map was produced with the technical assistance of Will vanRanden.

This map is designed to be overlain on the 1:50 000 geophysical maps of Open File 1994-10 (G).
