

Note: This map accompanies the YGS Open File 2023-1 report, which should be referred to for a complete description of the mapping methodology and definitions of polygon label codes.

This map serves as a general guide to surficial materials only, as it is primarily based on remote interpretation with limited field verification, and significant variation may occur within a polygon. Geotechnical field investigations such as test pitting and/or drilling would be required to fully characterize surficial materials prior to site specific activities.

SURFICIAL MATERIALS

Surficial material polygon map units were classified using the Terrain Classification System for British Columbia (Howes and Ken, 1997) with minor modifications developed for Yukon Geological Survey's mapping standards to include a wider variety of permafrost features and age classifications.

A sample polygon map label or terrain unit is shown below. Surficial material forms the core of the polygon map labels and is represented by the single upper case letter in each terrain unit. Up to 3 textural codes are written in lower case to the left of each surficial material (listed in order of decreasing dominance), and up to 3 surface expression codes are written in lower case to the right. An upper case activity qualifier (A = active; I = inactive) may be shown immediately following the surficial material. Alternatively, the glacial qualifier "G" may be written immediately following the surficial material to indicate materials that were deposited in close proximity to glaciers. Age is indicated by an upper case letter that follows the surface expression but precedes any geomorphological process modifiers. Up to 3 geomorphological processes (upper case letters) and subclasses (lower case letters) always follow a dash ("-") symbol. Detailed definitions for the polygon map label codes are provided in subsequent sections.

Up to 4 terrain units may be combined in a complex polygon map label if they could not be differentiated at the scale of mapping. Each terrain unit is separated by a delimiter that either indicates relative proportions between the components (":", ";", "T") or stratigraphic relationships ("^").

zclGpIM-Xt

TEXTURE	SURFICIAL MATERIAL	SURFACE EXPRESSION
Specific clastic textures	LAZULINE	ag apron
a blocks (>256 mm, angular)	CL Colluvium	d depression (>1m thick)
b boulders (>256 mm, rounded)	E Eolian	f fan(s)
k cobble (64-256 mm, rounded)	FA Active Floodplain	h hummock(s)
p pebbles (2-64 mm, rounded)	FG Glaciofluvial	i delta
s sand (0.062-2 mm)	M Marine (at)	m rolling
t silt (0.002-0.062 mm)	L Lacustrine	p plain
c clay (<0.002 mm)	GL Glacio-lacustrine	r ridge(s)
Grouped clastic textures	M Marine (at)	t terrace(s)
f mixed fragments (>2 mm, rounded and angular)	O Organic	u undulating
g gravel (>2 mm, rounded, mix of S, P, K)	B Bedrock	w wear (<1 m thick)
r rubble (2-256 mm, angular and perched)		w wedge of variable thickness
m mud (mix of silt and clay)		
v shells (shell or shell fragments)		
n salt (evaporite crystals)		
Organic terms		
o fluxic organic (poorly decomposed)		
u mesic organic (intermediate decomposition)		

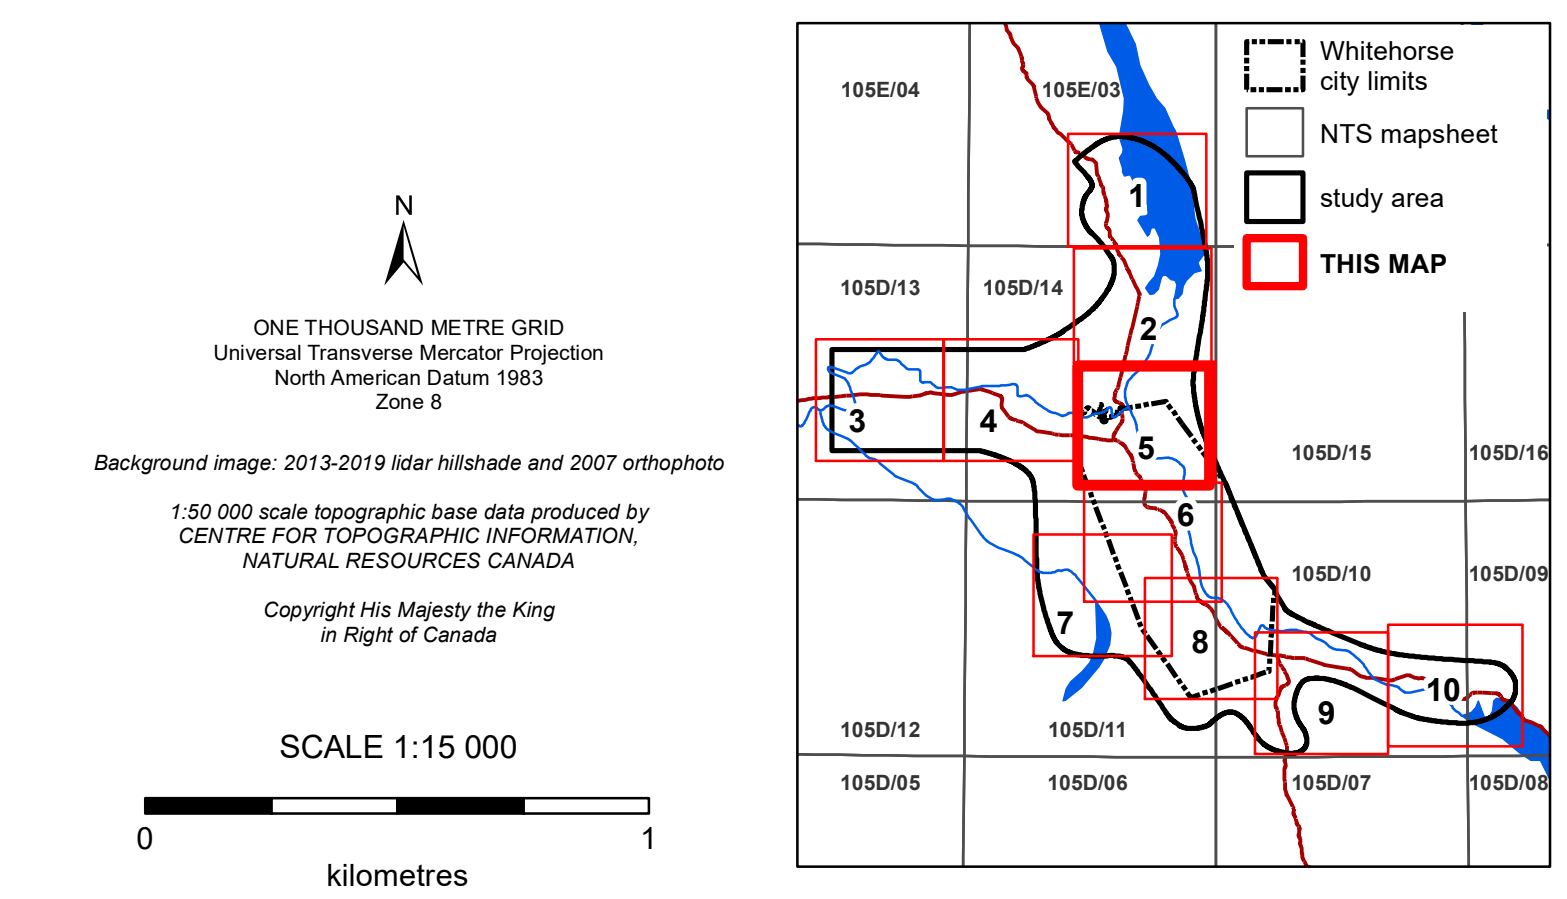

GEOMORPHOLOGICAL PROCESS	PERMAFROST PROCESS SUBCLASSES (follows -X)	HYDROLOGICAL PROCESS SUBCLASSES (follows -U)
Erosional processes	f thaw flow slides	b beaver dams
Fluvial and hydrological processes	p permafrost mounds (tiltalia, palsas, peat plateaus)	
Gully erosion	t thermokarst subsidence	
Fluvial and hydrological processes		
M meandering floodplain		
Mass movement processes		
U inundation		
R rapid landslide		
L undifferentiated landslide		
Periglacial processes		
N nivation		
S soilification		
X permafrost		
D degradation		
H hettled		
T toe contact		

COMPOSITE SYMBOL DELIMITERS

terrain unit(s) on either side of the symbol are of approximately equal proportion.
 terrain unit(s) before symbol is more extensive than the following one(s).
 (Also denotes partial/discontinuous cover if located at front of label.)
 // terrain unit(s) before symbol is much more extensive than the following one(s).
 terrain unit(s) before the symbol stratigraphically overlies the following one(s).

SYMBOLS

GEOLOGICAL BOUNDARIES:	GEOLOGICAL FEATURES:	LANDSLIDES:	Other Symbols
— defined	— berm or dike	— old	— stream
- - - approximate	— cross section profile, ERT transect	— recent	— highway
— assumed	— cross section profile, unclassified	— direction of movement	— major road
- - - - - limit of mapping	— escarpment, unclassified	— headwall scarp	— local road
	— gravel pit		— other road
	— gully		— Whitehorse city limits
	— esker, direction known		— legal survey parcel
	— lineament		— First Nation Settlement Land
	— meltwater channel, minor, direction known		
	— meltwater channel, major, direction unknown		
	— meltwater channel, major, flow direction		
	— moraine ridge		
	— sand dunes		
	— shoreline (Holocene)		
	— glacial lake shoreline		
	— streamlined landform		
	— water track		
			— ground observation site
			— stratigraphic section
			— gravel pit, active or recently active
			— gravel pit, historical
			— open pit mine
			— drill hole
			— water well (from Yukon water well registry; overburden depth in m)
			— spring
			— mine
			— kettle
			— permafrost mound
			— thermokarst depression
			— sand dune, cliff-top
			— landslide, active layer detachment
			— landslide, debris flow
			— landslide, retrogressive blow slump
			— landslide, unclassified
